# How to design the Digital Trust Label so that it works for the user

Summary of the global study on the user perspective on the mechanism, value proposition and design of the Swiss Digital Trust Label

Conducted in Switzerland, Scandinavia, Eastern Europe and the US

## **Starting point**

For over two years, the Swiss Digital Initiative Foundation together with partners such as EPFL worked on developing a Digital Trust Label. The Label should give users more information and transparency, but also adhere to a certain standard for digital services. What became clear is that this is a long-term endeavor. You don't just launch a new digital trust label overnight. The responsibility is too great: to the companies that carry the label, to the consumers who want to rely on it, and to society, for which it is supposed to offer a new piece of security in the digital space.

With the aim of launching a label that is understood by users, that achieves the intended effect and that can successfully establish itself on the market, we therefore set up a **global user survey**.

The following questions were the focus:

- What are possible **different mechanisms for the Digital Trust approach** (informative vs. normative)? What reactions and thoughts do the different approaches trigger in the users' mind?
- Which approach is most suitable for helping users to assess the trustworthiness of the digital service?
- What kind of value proposition do the users except from the Digital Trust Label so that it impacts buying decisions?
- What should be considered regarding layout/design and naming?
- Are there any regional differences regarding customer perception?

The study, including the development of the Digital Trust Label prototypes, was led and implemented by the strategy consultancy bruhnpartner.

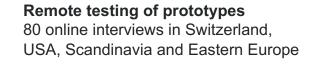

## **Overview of study set-up**

## **Starting point**

Mission of the Digital Trust Label and criteria list (provided by SDI)

**Development of low-fidelity prototypes**Different value propositions, information
displays and test settings

#### Interview number

80 interviews (20 per region)

#### Study period

Phase 1: 18.12.2020 - 23.12.2020 Phase 2: 06.01.2021 - 25.01.2021

#### Interview duration

45-60 minutes

#### Methodology

Online-based interviews in German or English language

- Live webcam connection via Microsoft Teams
- Interactive click environment using the booking.com website as an example
- Registration of respondent-computer interaction
- Guideline-based semi-structured interviewing

# Key finding to start with - High public demand for a digital trust solution

A general feeling of insecurity in a complex digital world fosters openness of users towards solutions that address the topic of digital trust

**Digital trust is a topic for everyone.** Users across all regions recognize the importance of the topic and the need for solutions to increase digital trust.

A Digital Trust Label can be a useful tool for almost everyone. Over 80% of participants evaluate a Digital Trust Label as useful for themselves. Those that do not see an added value in a Digital Trust Label do so due to different reasons:

- High digital competence and therefore no need for an independent assessment.
- General mistrust on the internet and resignation about data security and usage.

A Digital Trust Label has a direct influence on people using websites or not. Moreover, it can encourage users to more consciously examine the topic of trustworthiness of digital services.

I do see that this would be a huge benefit in many aspects.

Especially for users that are not so fluent on the internet.

It is a good idea and initiative. We need it, especially now.

I'm happy that something is happening, that somebody is working on this topic. That someone is investing money on this cause of education.

It brings all the information that is important today. We daily hear news in Sweden how banking apps get hacked. Also, with Corona adding to the feeling of insecurity, this kind of approach makes you feel safer in general.

Angenommen ich suche ein Hotel und ich gehe über 3 Plattformen und ich entdecke nur ein geprüftes, dann ist dennoch die Leistung an sich zu bewerten. Wäre die Leistung gleich, nehme ich das mit dem Emblem.

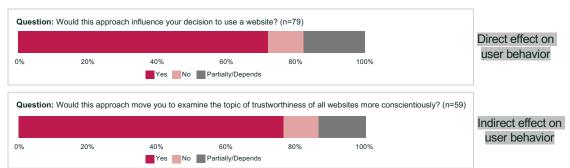

# Strong impact - A digital trust label has direct and indirect effects on the users

A digital trust label has a direct influence on people using websites or not. Moreover, it can encourage users to more consciously examine the topic of trustworthiness of digital services

Between websites with an otherwise equal range of services, users mostly prefer the one with the digital trust label or the higher rating, making it a **criterion for digital service selection**.

Moreover, the value of a digital trust label goes beyond sitespecific benefits as it contributes positively to a feeling of security in an environment that tends to be perceived as insecure.

In addition to a generally higher level of interest in the topic, the label can be a **door opener to user education** as users could also be moved to pay more attention to details, such as the four core principles and their meaning.

Angenommen ich suche ein Hotel und ich gehe über 3
Plattformen und ich entdecke nur ein geprüftes, dann ist dennoch die Leistung an sich zu bewerten. Wäre die Leistung gleich, nehme ich das mit dem Emblem.

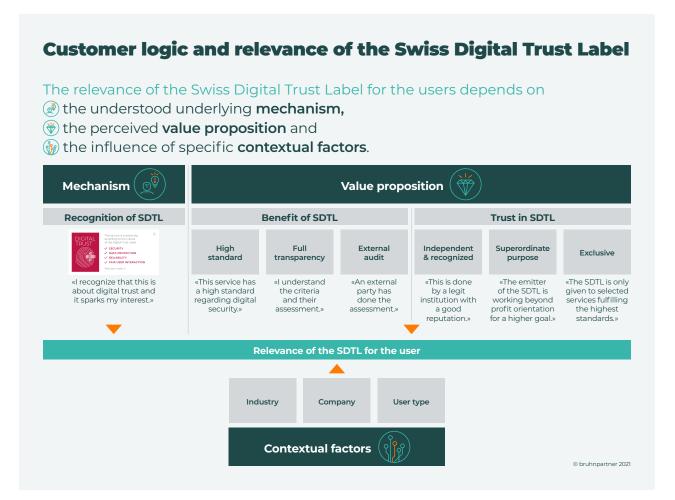

Because if I use 2 or three pages to spend my holidays and all of those have this seal, I will take the one with the higher rating.

Yes, it brings all the information that is important today. We daily hear news in Sweden how banking apps get hacked. Also, with Corona adding to the feeling of insecurity, this kind of approach makes you feel safer in general.

Ja, ich denke schon. Ich würde mich insbesondere mit der Bedeutung der vier Kategorien genauer beschäftigen.

# **Key findings in detail - Framework for the design of the Digital Trust Label**

## **Key findings - Mechanism and value proposition**

#### Mechanism

- The premise for a strong value proposition is the right choice of the underlying mechanism to create recognition, value and ultimately trust with the user.
- The internet users primarily value a solution that focuses on transparency and information enhanced with elements of a normative approach, e.g., an assessment of trust inducing features of a website.

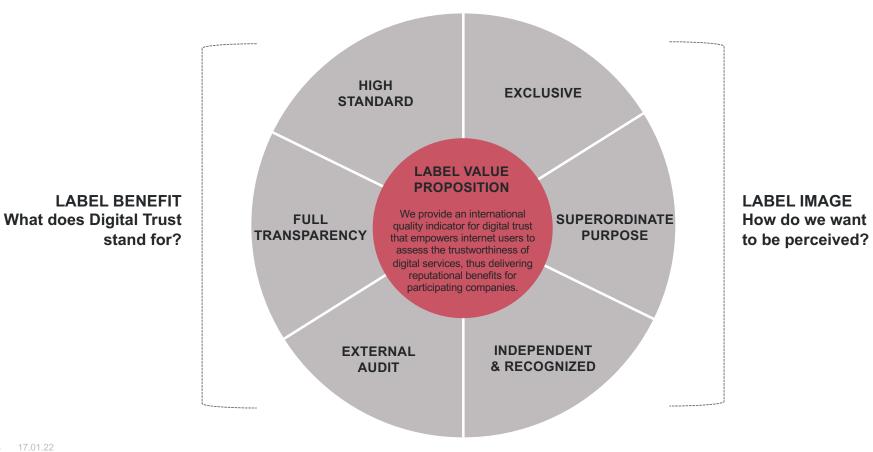

## Value proposition and positioning

- The Digital Trust Label must be a recognized top-standard that users can relate to a familiar benchmark allowing them to make a quick decision about the website's trustworthiness.
- For establishing a trustful relationship with the users, the solution should provide transparency about the degree of criteria fulfillment.
- Users must understand that the evaluation process is performed by an external party in a well thought-through and differentiated assessment process.
- For increasing trust in the approach, it should be pointed out, that the project (1) is endorsed by an **independent institution** that people know and trust, (2) is working beyond profit orientation for a **higher goal** and (3) is **exclusive** for companies which strive for high digital trust standards.

## Implications for the label:

- Combination of descriptive and normative approaches
- Strategic direction for the value proposition of a Digital Trust Label: "We provide an (externally audited and controlled) international quality indicator for digital trust that empowers internet users to assess the trustworthiness of digital services, thus delivering reputational benefits for participating companies."

## **Key findings - Value proposition with benefit and image**

## **Key findings - Value proposition (detailed explanation)**

#### LABEL BENEFIT LABEL IMAGE What does Digital Trust stand for? How do we want to be perceived? The Digital Trust Label must be a recognized top-standard that users can relate to a The Digital Trust Label must establish itself as THE approach for the topic of Digital Trust familiar benchmark allowing them to make a guick decision about the website's and make sure that it maintains exclusivity. trustworthiness. The idea is to show that this website If Digital Trust is the only organization giving this kind of meets the standards that are set. And that HIGH certificate to websites, it would be very good. Because if **EXCLUSIVE** makes the statement that it is a safe website. **STANDARD** there were more organizations it would be confusing. The Digital Trust Label should demonstrate a For establishing a trustful relationship with the users, **LABEL VALUE** superordinate purpose that drives the actions of the the solution should provide transparency about the **PROPOSITION** organization behind it. degree of criteria fulfillment. We provide an international " **SUPERORDINATE FULL** quality indicator for digital trust **TRANSPARENCY PURPOSE** When you got the courage to show me your " that empowers internet users to assess the trustworthiness of I think that the majority of people that are on the internet do not shortcomings, then it gives me instantly so much more digital services, thus delivering understand the importance of trust if you go to a website. There is trust in your claim and so on. So, if you run a business where reputational benefits for a lack of education. I am happy that something is happening, you should have this brand and you shouldn't be afraid of the participating companies. that somebody is working on this topic. That someone is downside of the coins where you are not up to standard. The courage to let me know tells me that even when you have investing money on this cause of education. a problem or an issue, you are still an honest person. **EXTERNAL** INDEPENDENT **AUDIT** & RECOGNIZED Users must understand that the evaluation process is performed by an external The project should be endorsed by an independent institution that people perceive as trustworthy. "Swissness" should be leveraged as from an international party in a well thought-through and differentiated assessment process. perspective the Swiss origin of the Digital Trust Label supports the perception of an independent and trustworthy approach. When you start something new like this you must start creating awareness and create background about the verification, processes and so on. Because anyone can design a label The idea that it is Swiss gives me also an impression of and put it into place. This makes it a backed-up label. security. It is an impression I have regarding them and

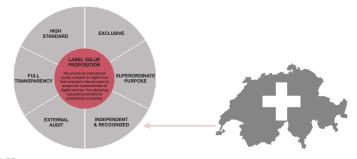

their culture. It comes from from a technological place.

## **Excursus: Leveraging Swissness**

"Swissness" should be leveraged as from an international perspective the Swiss origin of the digital trust label supports the perception of an independent and trustworthy approach

The **positive country image from an international perspective** is based on positive associations with Swiss products and Switzerland being the center of many international organizations and initiatives. It is associated with neutrality, high quality, high standards, attention to detail and integrity.

The connection between Switzerland and high security standards primarily comes from established industries, in particular the banking sector. **These positive associations are also transferable to the digital context.** In addition, some users also connect Switzerland with digital products and technology.

I see Switzerland as a country with high standards and integrity. I think of Switch watches. I have a positive association with Switzerland.

It is a very good thing that it comes from Switzerland. Switzerland is considered to be neutral and from an international standpoint that is very strong. Switzerland has a strong banking background that also contributes to trust.

I understood that it is from Switzerland. It is better that it is coming from Switzerland than coming from America. Maybe it is a European bias. Switzerland, they have a reputation of being punctual, being on time, being rational.

Americans perceive European products as higher quality. Knowing that people from Switzerland are doing something like this makes me think that they can do a good job also in the digital context.

Americans perceive European products as higher quality. Knowing that people from Switzerland are doing something like this makes me think that they can do a good job also in the digital context.

Source: Quotations of the users from the study

## **Key findings - design and layout**

- The design and positioning of the Digital Trust Label must support at first sight that it is perceived as relevant and from a credible source.
- The Digital Trust Label must quickly establish a secure feeling for the users and empower them to build their own opinion based on transparent information given in the approach.
- In order to address all user groups, it is crucial to balance simplicity with enough information depth.
- Fewer words, more symbols and simple language should be applied in order to ease comprehensiveness for all user groups.
- Colors and symbols should be utilized to support the message the Digital Trust Label wants to convey based on the premise of not allowing multiple interpretations.
  - I am getting associations to McAfee Antivirus. I am skeptical about these kind of things on websites. When it comes to Digital Trust, I am critical about pop-ups. If it was incorporated on the website in some kind of way, it would be better.
    - In my impression, instead of talking to me as consumer it is explaining me something. This requires too much thinking. It should say: "You can feel safe here". And then, I have the decision to click on more and learn about and get further information.

- Taking a quick glance, I suppose I would not take the time to read this.

  A couple of key words for the criteria and the way they evaluate is enough. I would not scroll down and read all the points to be honest.
- It should be really easy for anyone to understand immediately at all levels. It should be understood also by a middle-schooler. "Encrypted" could also be "secure".
- As a consumer I am probably not reading, so the overall visual icons are very important, and I am looking more at those.

## Implications for the label:

- The design plays a crucial role in making the value proposition of the Digital Trust Label experienceable for the users.
- It all comes down to simplicity: "Digital Trust" shows the highest potential as brand name for the Digital Trust Label.
- The ideal click-structure consists of 3 levels, each with different objectives.

## Key findings - contextual factors with impact on the label

#### Industry

Certain industries and the attributes associated with them can have both, a positive or negative effect on the Digital Trust Label. Relevant proof points are the industry reputation in a security (e.g., banks) or privacy context (e.g., social media).

Eine Bank wäre etwas, wo man profitiert, weil die Leute ja davon ausgehen, dass sie in punkto Sicherheit überall am besten performt. Wenn die da mitmachen, wäre das für das Label wahrscheinlich gut. Für den Lerneffekt braucht man die grossen Seiten, die eine positive Konnotation haben.

People do not trust too many social media sites. They do not think it is safe, so I am not sure whether this would be good for the credibility of the label. For a business context like in booking.com it is good.

#### Company

The perceived trustworthiness of specific companies and their digital services influences the perception of the Digital Trust Label and vice versa. For the formation of initial trust, the vet unknown Digital Trust Label can profit from positive connotations of a known website (positive "rebouncing effect"). If the company is not known, the Digital Trust Label has the potential to increase trust on the website but is also more at risk to be perceived as a fake.

I must see this on many websites. It is not about the design, but about how many big companies will be using this. If users see this on big pages, they will automatically trust it.

Using it on Facebook? It would change my opinion on the label. I wouldn't trust it that much.

### User type

"Quick users" want to use the Digital Trust Label primarily as a reliable confirmation of the trustworthiness of digital services and tend to be less willing to learn.

"Detailed users" tend to be more willing to learn and value the possibility of reflecting on their online behavior behavior and assessing digital services in a differentiated way. For this they like to dive into well-prepared content.

I just want there to be one sentence, "Swiss Digital approved" -Three words maximum. Everybody over 50 will say what does it say do I even care?

It depends on how much time I had. If I had some time, it would be really interesting for me to read more. The information is really inviting and easily structured.

## **Key findings - regional factors**

The overall impression is the same, but there are some regional differences

#### USA

- Show the clearest preference for a normative approach
- Tend to think from a business perspective when evaluating the SDTL ("What is beneficial for companies?" instead of "what is beneficial for me?")
- Tend to be more receptive to competitive mindset
- See it as rather important that the SDTL conveys a (solely) positive feeling

#### Scandinavia

- Show the clearest preference for a descriptive approach
- A purely normative approach can even be understood as imposing an opinion
- Tend to have the highest expectations for the argumentative basis of the SDTL
- Different meaning of "transparency" in Finnish. The word is understood in context but is not particularly suitable (Finno-Ugric language)

#### **Switzerland**

- Only in this region "label" is a common term used to describe trust surrogates
- The name "Fact Table" is more accepted for a descriptive approach than in the other regions

#### **Eastern Europe**

- Tend to think from a business perspective when evaluating the SDTL ("What is beneficial for companies?" instead of "what is beneficial for me?")
- Different meaning of transparency in Hungarian. The word is understood in context but is not particularly suitable (Finno-Ugric language)

## Summary of the core results of the study transferred to the label

## Mechanism and value proposition

- The Digital Trust Label combines a descriptive and normative approach putting together the best of both worlds.
- The Digital Trust Label stands for a relevant value proposition: "We provide an (externally audited and controlled) international quality indicator for digital trust that empowers internet users to assess the trustworthiness of digital services, thus delivering reputational benefits for participating companies."

## Label benefit and label image

- The label delivers three key benefits: high standard, full transparency, external audit
- The label represents three key image values: exclusive, subordinate purpose, independent and recognized

## **Design and layout**

- The label makes visible at first glance that it is perceived as relevant and from a credible source.
- It establishes a secure feeling for users and empowers them to build their own opinion.
- It balances simplicity with enough information depth.
- It eases comprehensiveness by fewer words, more symbols and simple language.
- It uses colors and symbols to support the message.

This service is trustworthy according to the criteria of the Digital Trust Label.

- ✓ SECURITY
- ✓ DATA PROTECTION
- ✓ RELIABILITY
- ✓ FAIR USER INTERACTION

## **About the SDI**

The Swiss Digital Initiative (SDI) is an independent, non-profit foundation based in Geneva, founded in 2020 by digitalswitzerland and under the patronage of Federal Councilor Ueli Maurer. The Swiss Digital Initiative pursues concrete projects with the aim of securing ethical standards and promoting responsible conduct in the digital world. It brings together academia, government, civil society and business to find solutions to strengthen trust in digital technologies and in the actors involved in ongoing digital transformation.

## **About bruhnpartner**

bruhnpartner is an internationally active consultancy for the design of customer-centric transformation. We enable companies to understand the logic of their customers and translate it into successful strategies. Our strategy work is applied at different levels: We develop strategies for the entire company and specific business areas, often focusing on service business development. We design brand positioning strategies und structure brand portfolios. We develop strategies for customer loyalty and customer value enhancement.
